

UNIQUE Registry

The First Permanent On-Chain Ticker Standard on BNBChain

"One ticker. One token. Forever."

Contract	0x12f5d57243b8f8b7897ABDC8530950dd1071E74e
Network	BNB Smart Chain Mainnet
Deployed	April 18, 2026
License	MIT Open-Source
Website	uniqueregistry.io

UNIQUE Registry solves this with a single, permanent, on-chain record. One registration. Permanent. On-chain. Enforced on every integrated launchpad. The protocol is deliberately neutral. It belongs to no launchpad. This structural neutrality gives it the legitimacy to function as a true ecosystem-wide standard.

"The need is proven. The standard does not exist yet."

The Problem

BNBChain's launchpad ecosystem is one of the most active in the world. Four.meme alone has processed over 384,000 token creations, with a peak of 13,492 tokens in a single day and a consistent average above 10,000 per day since October 2025. Of all tokens created, only 1.34% ever graduate to a DEX listing. The remaining 98.66% are noise: clones, rugs, and ephemeral projects.

Clone Token Epidemic

When a token gains traction, clone tokens appear within minutes. Identical tickers, identical imagery. Users buy the wrong token. Builders lose their community before they can build it. Trust in the ecosystem erodes.

PVP Culture

The current environment rewards speed over substance. Snipers, coordinated dumps, and identity exploitation have made it structurally difficult for legitimate builders to launch and grow without being immediately copied and undercut.

BNBChain is now the world's leading blockchain for AI agents, with over 150,000 agents deployed as of April 2026, representing a 43,750% increase since January 2026. One in every three AI agents running on any blockchain operates on BNBChain. Platforms like Four.meme's Agentic Mode and Bullshot.io already allow AI agents to deploy tokens autonomously. Without a ticker registry, these agents create ticker collisions at a scale and speed no human moderation can address.

Existing Solutions Are Insufficient

Current approaches to ticker protection are temporary and platform-specific. Four.meme introduced a 72-hour ticker lock, a useful first step, but limited to their platform and expiring after three days. No solution exists today that is permanent and on-chain.

The Solution

UNIQUE Registry is a permanent, neutral, on-chain ticker registry deployed on BNBChain Mainnet. When a ticker is registered through UNIQUE, it is permanently associated with the registering wallet and recorded as a contract event on BscScan. The ticker cannot be registered by any other party.

Permanent Once registered, a ticker is protected forever. No expiry. No renewal. Immutable by design.	Neutral UNIQUE belongs to no launchpad. This structural neutrality allows it to function as a true ecosystem standard.
Network Coverage The on-chain record is permanent and publicly verifiable. Protection is enforced on every launchpad that integrates UNIQUE.	On-Chain Every registration is recorded on BscScan. The Certified UNIQUE stamp lives in contract events. Fully verifiable by anyone.

Two Certification Stamps

UNIQUE Certified For new tokens launching through a partner launchpad. The builder registers at launch, and the stamp certifies that this ticker was registered first by this creator through a verified launchpad.	OG Verified For established projects that already exist and want to secure their ticker retroactively. These registrations go through a manual verification process.
---	--

"UNIQUE Certified means you were born with the protection. OG Verified means you existed before and came to claim it."

Network	BNB Smart Chain Mainnet · Language: Solidity 0.8.20
License	MIT · Verified and open-source on BscScan · Deployed: April 18, 2026

Security

ReentrancyGuard is applied to all payable functions, preventing reentrancy attacks. A 48-hour timelock governs all changes to fees and contract ownership, ensuring no parameter change can occur without a transparent delay period visible on-chain. An emergency pause mechanism allows the contract owner to halt all state-changing operations in the event of a critical incident, without affecting read access or registered data.

Ticker Normalization

Tickers are accepted from 1 to 20 characters with full Unicode support, including Latin, Cyrillic, Chinese, Japanese and other scripts. All tickers are normalized to uppercase before registration — Latin a-z to A-Z, Cyrillic a-ya to A-YA — preventing near-duplicate registrations and ensuring case-insensitive uniqueness across the registry.

Registration Paths

Tier	Path	Fee	Split	Use Case
Tier 1	Partner Launchpad	0.1 BNB	50% / 50%	New token launches via integrated launchpad
Tier 2	OG Verified	0.05 BNB	100% protocol	Established projects securing existing ticker
Tier 3	certifyRecord()	Free	N/A	Strategic partnerships and official protocol use

Key Contract Functions

<pre>// Check if a ticker is already registered. Read-only, free to call. isTaken(string ticker) → bool // Register a ticker via partner launchpad (Tier 1). Payable, 0.1 BNB. registerTicker(string ticker) → void // Register an OG Verified ticker (Tier 2). Manual verification required. certifyOG(string ticker, address project) → void // Strategic and official protocol registrations (Tier 3). Gated. certifyRecord(string ticker, address project) → void // Reserve a ticker up to 7 days before deployment. Payable, ogFee/2. reserveTicker(string ticker) → void // Schedule a revoke with 48-hour timelock. Owner only. scheduleRevoke(string ticker) → void // Execute revoke after timelock has elapsed. executeRevoke(string ticker) → void // Register up to 50 tickers in a single transaction. batchRegister(string[] tickers) → void</pre>
--

Pre-launch Reservation

A project can reserve its ticker up to 7 days before token deployment by calling reserveTicker(). The reservation fee is set at half the OG Verified fee. If the token is not deployed within the reservation window, the ticker is released automatically. This mechanism allows builders to secure their identity during the preparation phase without requiring the token to exist first.

Revoke with Timelock

Any registered ticker can be revoked by its owner through a two-step process. The owner calls scheduleRevoke(), which initiates a mandatory 48-hour timelock visible on-chain. After the delay has elapsed, executeRevoke() completes the operation and releases the ticker. This mechanism provides a structured, transparent answer to collision disputes and bad-faith registrations. The revoke is initiated by the UNIQUE protocol, with a mandatory 48-hour on-chain delay before execution. The process is fully visible and verifiable on-chain.

Batch Registration

Up to 50 tickers can be registered in a single on-chain transaction via batchRegister(). This function is designed for high-volume integration scenarios, including launchpad pipelines that process multiple simultaneous launches and AI agent deployments that operate at machine speed. Gas efficiency is maintained through optimized storage writes and custom error handling.

Launchpad Certification Badge

Launchpads that integrate UNIQUE Registry can apply for a certification badge through a double opt-in process: the launchpad signals a public on-chain, and UNIQUE confirms the certification. The badge is visible on the registry and serves as an intent trust signal for builders and users. It identifies platforms that enforce ticker uniqueness at the point of launch, distinguishing them from platforms that do not.

AI Agent Integration

UNIQUE Registry is designed to integrate natively with AI agent token deployment pipelines. Before deploying a token, an agent makes a single read call to isTaken(ticker). If the ticker is available, the agent registers it and proceeds with deployment. If taken, the agent selects an alternative. Batch registration further extends this capability, allowing agents managing multiple simultaneous deployments to register all tickers in a single transaction with no human oversight.

Ecosystem Integration

Launchpad Integration

Launchpad integration requires a single API call at token creation. The launchpad checks isTaken(ticker) before deployment. If available, it calls registerTicker(ticker) with the 0.1 BNB fee. The launchpad receives 50% of each registration fee automatically, on-chain, with no invoicing or delays required.

Integration benefits for launchpads include a trust layer for their users, additional recurring revenue, a higher quality signal for their platform, and improved graduation rates as serious builders are more likely to use certified platforms.

Existing Token Protection

Established tokens that have already graduated from launchpads can secure their ticker retroactively through the OG Verified tier. The registration does not interfere with the existing token in any way. It simply locks the ticker on the registry, preventing future clone launches from using the same identifier on any integrated platform.

No Conflict With Existing Infrastructure

UNIQUE Registry operates as a separate layer that sits on top of existing BNBChain infrastructure. It does not modify, interfere with, or require changes to any existing token, launchpad, or smart contract. Tokens that choose not to register continue to function exactly as before. The registry is additive, not restrictive.

uniqueregistry.io	UNIQUE Registry Whitepaper V2.0 · May 2026	0x12f5d57243b8f8b7897ABDC8530950dd1071E74e
-------------------	--	--

Revenue Model

UNIQUE Registry generates protocol revenue through registration fees. Each Tier 1 registration generates 0.1 BNB, split equally between the partner launchpad and the UNIQUE protocol treasury. Each Tier 2 OG Verified registration generates 0.05 BNB directed entirely to the protocol treasury.

Scenario	Daily Registrations	Protocol Revenue/Day	Annual Run Rate
Conservative (1 launchpad, 5%)	~500	~25 BNB	~\$5.4M
Realistic (3 launchpads)	~1,500	~75 BNB	~\$16.4M
Optimistic (BNBChain standard)	~5,000+	~250 BNB+	~\$54M+

Based on BNB at \$600. Conservative scenario assumes 5% adoption among serious builders across 10,000 daily token creations. Estimates only.

Roadmap

V1 — The Standard	Live	Contract deployed. Site live. OG registrations open. BD outreach active.
Launchpad Integrations	In Progress	Partner launchpads integrate UNIQUE API. Revenue sharing activates.
Security Audit	Planned	Third-party audit funded from protocol revenues.

Legal Notice

The UNIQUE Registry certification attests solely to the anteriority of a ticker registration in the UNIQUE Protocol registry. It does not constitute a validation, audit, endorsement, or financial recommendation regarding the associated project or token.

UNIQUE Protocol cannot be held liable for the quality, legitimacy, or performance of any registered project. Registration of a ticker does not confer any legal right over an existing registered trademark.

This document is not financial advice. UNIQUE Protocol certifies ticker registration only, not project quality or investment merit. This is not an offer of securities or investment products.
